RAINBOW GLITTER TECH

Rainbow Glitter Tech Technology is an innovative surface treatment technique that combines digital inkjet technology with modern materials science.

By using high-precision digital glue positioning technology, special crystal granules are precisely stacked onto the tile surface, which, after hightemperature sintering, form a translucent, three-dimensional crystal effect.

In low-light environments, the surface presents a soft, misty texture, while in direct strong light, millions of miniature prisms are instantly activated, sparkling like fragmented diamonds .

This technique imparts the natural mineral texture and artistic depth of stone to the tile surface while offering practical benefits like high wear resistance and easy maintenance.
